Model Optimization

Optimization refers to determining best parameters for a model, such that the loss function of the model decreases, as a result of which the model can predict more accurately.

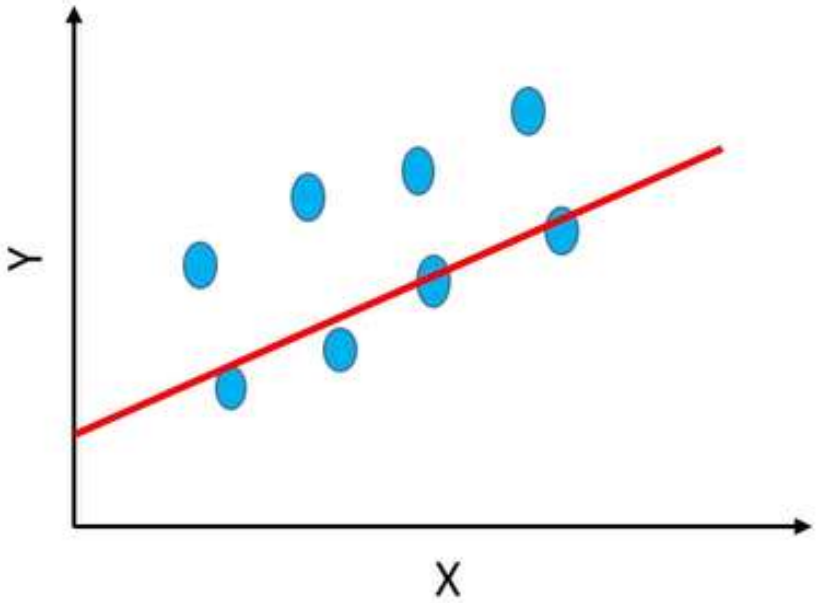

$Y = w_1X + b_1$

(w_1 & b_1 are the parameters of the line)

Model Optimization

Optimization refers to determining best parameters for a model, such that the loss function of the model decreases, as a result of which the model can predict more accurately.

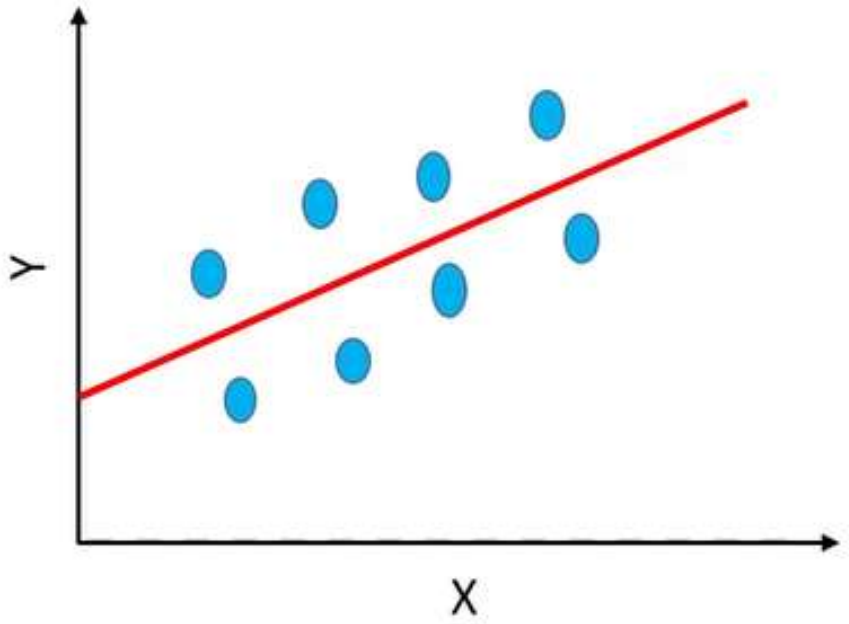

$Y = w_1X + b_1$

(w_1 & b_1 are the parameters of the line)

Model Optimization

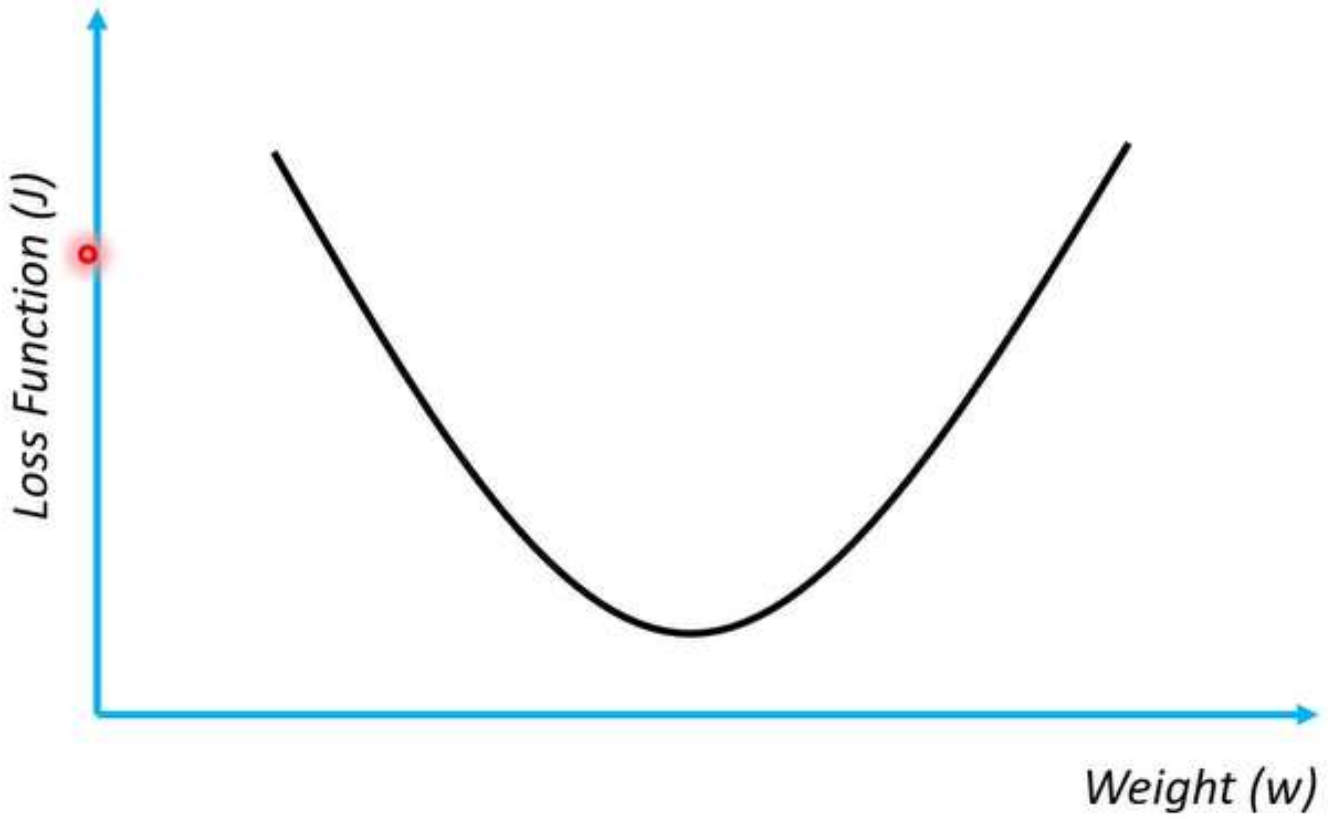

Optimization refers to determining best parameters for a model, such that the loss function of the model decreases, as a result of which the model can predict more accurately.

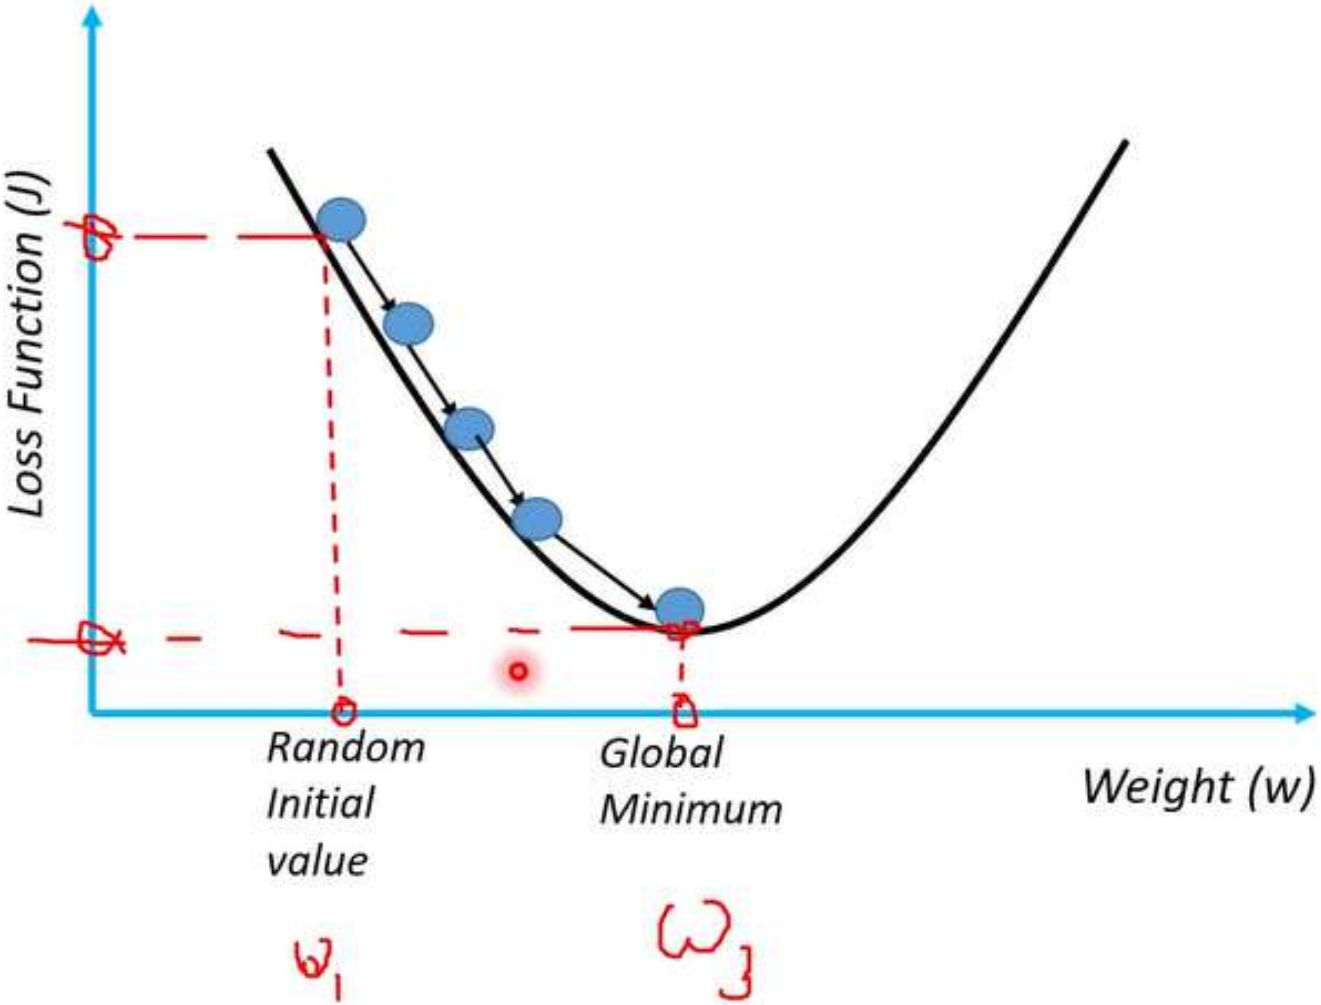

$Y = w_3X + b_3$

Hence, w_3 & b_3 are the best parameters

Gradient Descent

Gradient Descent

Gradient Descent

Gradient Descent is an optimization algorithm used for minimizing the loss function in various machine learning algorithms. It is used for updating the parameters of the learning model.

$$w = w - L*dw$$

$$b = b - L*db$$

w --> weight
b --> bias
L --> Learning Rate

dw --> Partial Derivative of loss function with respect to m

db --> Partial Derivative of loss function with respect to c

Gradient Descent

Gradient Descent is an optimization algorithm used for minimizing the loss function in various machine learning algorithms. It is used for updating the parameters of the learning model.

$$w = w - L*dw$$

$$b = b - L*db$$

w --> weight
b --> bias
L --> Learning Rate

dw --> Partial Derivative of loss function with respect to m w

db --> Partial Derivative of loss function with respect to c b

Gradient Descent in 3 Dimension
